Lab 2

1. 提交作業之前，建議可以先點選上方工具列的**Kernel**，再選擇**Restart & Run All**，檢查一下是否程式跑起來都沒有問題，最後記得儲存。
2. 請先填上下方的姓名(name)及學號(stduent_id)再開始作答，例如：

```
name = "我的名字"
student_id= "B06201000"
```

3. 四個求根演算法的實作可以參考lab-2 (https://yuanyuyuan.github.io/itcm/lab-2.html)，裡面有教學影片也有範例程式可以套用。
4. **Deadline: 10/9(Wed.)**

In [1]:

```
name = "黃宇文"
student_id = "B06201029"
```

Exercise 1 - Bisection

Use the bisection method to find roots of

$$f(x) = cosh(x) + cos(x) - c, \text{for } c = 1, 2, 3,$$

Import libraries

In [2]:

```
import matplotlib.pyplot as plt
import numpy as np
```

1. Define a function $g(c)(x) = f(x) = cosh(x) + cos(x) - c$ with parameter $c = 1, 2, 3$.

In [3]:

(Top)

```
def g(c):
    assert c == 1 or c == 2 or c == 3
    def f(x):
        return np.cosh(x) + np.cos(x) - c
    return f
```

Pass the following assertion.

In [4]:

cell-b59c94b754b1fc9e (Top)

```
assert g(1)(0) == np.cosh(0) + np.cos(0) - 1
### BEGIN HIDDEN TESTS
assert g(2)(0) == np.cosh(0) + np.cos(0) - 2
assert g(3)(0) == np.cosh(0) + np.cos(0) - 3
### END HIDDEN TESTS
```

2. Implement the algorithm

In [5]:

(Top)

```python
def bisection(
    func,
    interval,
    max_iterations=5,
    tolerance=1e-7,
    report_history=False,
):
    '''
    Parameters
    ----------
    func : function
        The target function
    interval: list
        The initial interval to search
    max_iterations: int
        One of the termination conditions. The amount of iterations allowed.
    tolerance: float
        One of the termination conditions. Error tolerance.
    report_history: bool
        Whether to return history.

    Returns
    -------
    result: float
        Approximation of the root.
    history: dict
        Return history of the solving process if report_history is True.
    '''

    a,b = interval
    assert func(a) * func(b) < 0, 'This initial interval does not satisfy the prerequisities!'

    num_iterations = 0
    a_next, b_next = a, b

    if report_history:
        history={'estimation':[],'error':[]}

    while True:
        c = (a_next + b_next) / 2

        error = (b_next - a_next) / 2

        if report_history:
            history['estimation'].append(c)
            history['error'].append(error)

        if error < tolerance:
            print('The approximation has satisfied the tolerance.')
            return (c, history) if report_history else c

        if num_iterations < max_iterations:
            num_iterations += 1

            value_of_func_c = func(c)
            if func(a_next) * func(c) < 0:
                a_next = a_next
                b_next = c
            elif func(a_next) * func(c) > 0:
                a_next = c
                b_next = b_next
            else:
                return c
        else:
            print('Terminate since the iterations have reached maximum.')
            return (c, history) if report_history else c
```

Test your implementation with the assertion below.

In [6]:

```
cell-4d88293f2527c82d
```

(Top)

```
root = bisection(lambda x: x**2 - x - 1, [1.0, 2.0], max_iterations=100, tolerance=1e-7, report_history=False)
assert abs(root - ((1 + np.sqrt(5)) / 2)) < 1e-7
```

```
The approximation has satisfied the tolerance.
```

---

3. Answer the following questions under the case $c = 1$.

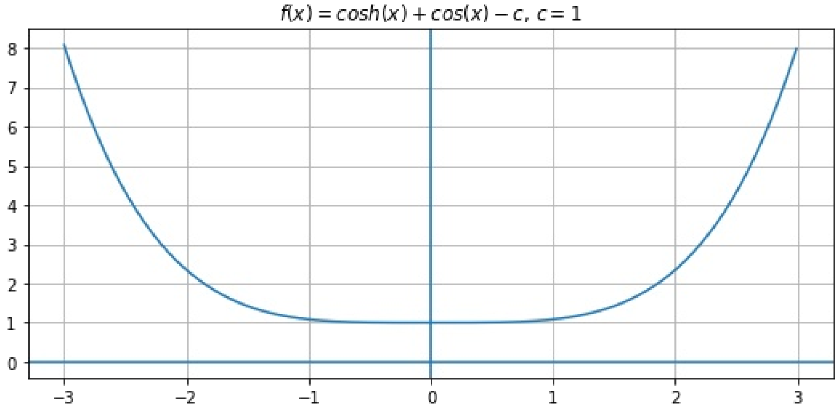
Plot the function to find an interval that contains the zero of f if possible.

In [7]:

(Top)

```
c = 1
f = g(c)

search_range = np.arange(-3.0, 3.0, 0.01)
fig, ax = plt.subplots(figsize=(9, 4))
ax.plot(search_range, f(search_range))
ax.set_title(r'$f(x)=cosh(x)+cos(x)-c$, $c=$%d' % c)
ax.grid(True)
ax.axhline(y=0)
ax.axvline(x=0)
plt.show()
```



According to the figure above, estimate the zero of f.

For example,

```
root = 3         # 單根
root = -2, 1     # 多根
root = None      # 無解
```

In [8]:

(Top)

```
root = None
```

In [9]:

cell-d872c7c57f11c968 (Top)

```
print('My estimation of root:', root)
### BEGIN HIDDEN TESTS
if root == None:
    print('Right answer!')
else:
    raise AssertionError('Wrong answer!')
### END HIDDEN TESTS
```

```
My estimation of root: None
Right answer!
```

Try to find the zero with a tolerance of 10^{-10}. If it works, plot the error and estimation of each step. Otherwise, state the reason why the method failed on this case.

(Top)

The function $cosh(x) + cos(x) - 1$ is always positive. The product of functions of any two intervals will never less than zero, thus it has no roots.

---

4. Answer the following questions under the case $c = 2$.

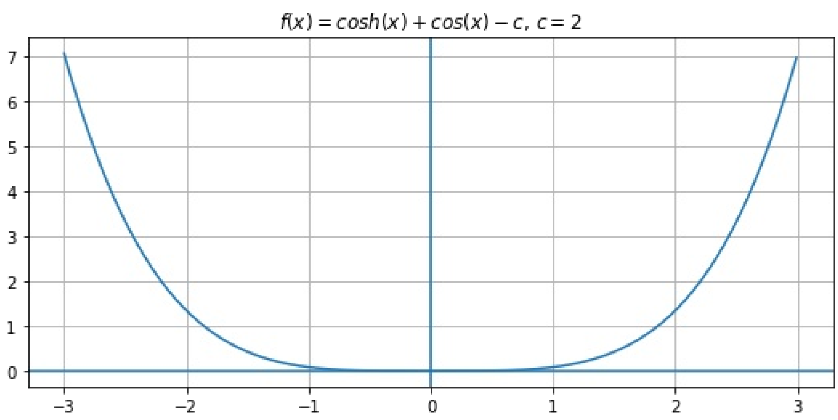
Plot the function to find an interval that contains the zero of f if possible.

In [10]:

(Top)

```
c = 2
f = g(c)

search_range = np.arange(-3.0, 3.0, 0.01)
fig, ax = plt.subplots(figsize=(9, 4))
ax.plot(search_range, f(search_range))
ax.set_title(r'$f(x)=cosh(x)+cos(x)-c$, $c=$%d' % c)
ax.grid(True)
ax.axhline(y=0)
ax.axvline(x=0)
plt.show()
```



According to the figure above, estimate the zero of f.

For example,

```
root = 3        # 單根
root = -2, 1    # 多根
root = None     # 無解
```

In [11]:

(Top)

```
root = 0
```

In [12]:

cell-20fddbe6fa4c437b (Top)

```
print('My estimation of root:', root)

### BEGIN HIDDEN TESTS
assert type(root) is float or int, 'Wrong type!'
### END HIDDEN TESTS
```

```
My estimation of root: 0
```

Try to find the zero with a tolerance of 10^{-10}. If it works, plot the error and estimation of each step. Otherwise, state the reason why the method failed on this case.

(Top)

As the root is zero, $func(a) \times func(b) \le 0$ or $func(a) \times func(b) \ge 0$. It does not satisfy the prerequisities.

---

5. Answer the following questions under the case $c = 3$.

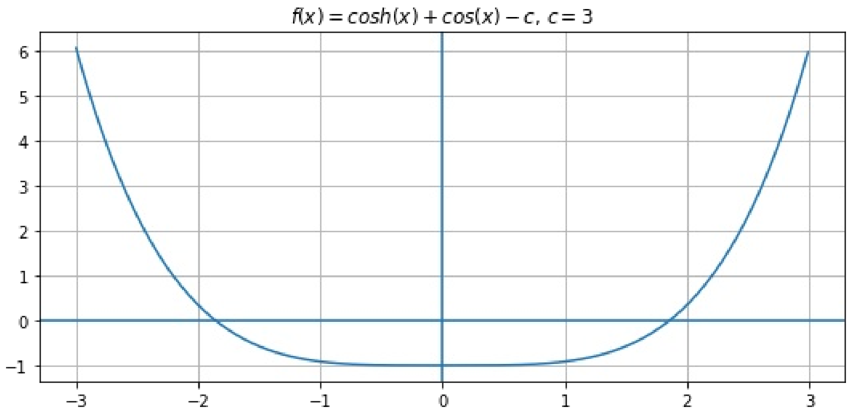
Plot the function to find an interval that contains the zeros of f if possible.

In [13]:

(Top)

```
c = 3
f = g(c)

search_range = np.arange(-3.0, 3.0, 0.01)
fig, ax = plt.subplots(figsize=(9, 4))
ax.plot(search_range, f(search_range))
ax.set_title(r'$f(x)=cosh(x)+cos(x)-c$, $c=$%d' % c)
ax.grid(True)
ax.axhline(y=0)
ax.axvline(x=0)
plt.show()
```



According to the figure above, estimate the zero of f.

For example,

```
root = 3        # 單根
root = -2, 1    # 多根
root = None     # 無解
```

In [14]:

(Top)

```
root_1 = bisection(g(3), [0, 3], max_iterations=50, tolerance=1e-7, report_history=False)
root_2 = bisection(g(3), [-3, -1], max_iterations=50, tolerance=1e-7, report_history=False)
root = root_1, root_2
```

```
The approximation has satisfied the tolerance.
The approximation has satisfied the tolerance.
```

In [15]:

cell-06ec0b20844075c7

(Top)

```
print('My estimation of root:', root)

### BEGIN HIDDEN TESTS
assert type(root) == tuple, 'Should be multiple roots!'
### END HIDDEN TESTS
```

```
My estimation of root: (1.8579208552837372, -1.8579208254814148)
```

Try to find the zero with a tolerance of 10^{-10}. If it works, plot the error and estimation of each step. Otherwise, state the reason why the method failed on this case.

    report_history=True
)
print(solution)
```

```
The approximation has satisfied the tolerance.
-1.8579208291484974
```

In [20]:

```
fig, axes = plt.subplots(3, 1, figsize=(16, 9))
ax1, ax2, ax3 = axes

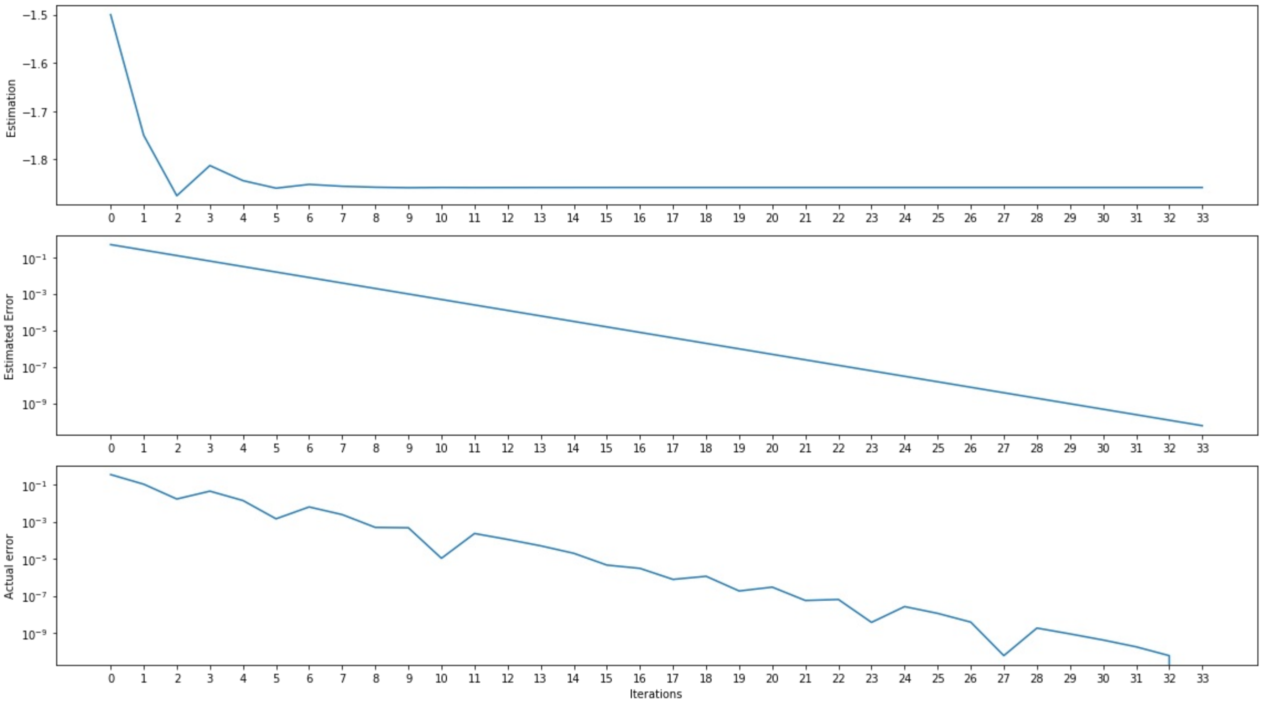
num_iterations = len(history['estimation'])
iterations = range(num_iterations)
for ax in axes:
    ax.set_xticks(iterations)

ax1.plot(iterations, history['estimation'])
ax1.set_ylabel('Estimation')

ax2.plot(iterations, history['error'])
ax2.set_ylabel('Estimated Error')
ax2.set_yscale('log')

actual_error = np.abs(history['estimation']-np.array(solution))
ax3.plot(iterations, actual_error)
ax3.set_ylabel('Actual error')
ax3.set_yscale('log')
ax3.set_xlabel('Iterations')

plt.tight_layout()
plt.show()
```



Discussion

For all cases above(c=1,2,3), do the results(e.g. error behaviors, estimations, etc) agree with the theoretical analysis?

(Top)

For $c = 1$, the function does not satisfy the prerequisties.\ For $c = 2$, the function cut the x axis at only one point.\ For $c = 3$, the results agree with the theorical analysis. Bisection method has a linear approximation.
